

## **Read-me File**

Please copy the folders on this website onto your computer.

Simulations of Simulink-based design examples require that you have the computer program Simulink (version 6.0 or higher) installed on your computer.

These simulation files are enhanced (compared to those in the book) by including additional features:

- Double-click on the Start button to automatically execute the associated MATLAB m-file.
- Plotting of results using MATLAB is only possible after the simulation has been fully executed. After such execution, double-click on the Plot button to automatically execute the associated MATLAB m-file.

Occasionally please check the website for additional information and corrections to the material in this book and the simulations files on this website.
